

Day 18 – Region Performance

Data Analytics Track | Excel & Power BI

Objective: Compare sales and profit across regions, summarize performance, and rank regions.

Regional Summary

Region	Orders	Sales	Profit	Margin	Sales Rank	Profit Rank
East	227	\$32,605.44	\$3,718.79	11.41%	1	2
West	222	\$29,031.28	\$3,728.79	12.84%	2	1
Central	187	\$23,974.86	\$1,677.63	7.00%	3	4
South	164	\$20,632.96	\$2,166.86	10.50%	4	3

Overall sales: \$106,244.54 | Overall profit: \$11,292.07 | Overall profit margin: 10.63%.

Analysis

The region summary groups orders by region and compares both sales and profit. Sales measure revenue generated, while profit reflects the amount remaining after costs. Looking at both measures helps identify regions where revenue and profitability move differently.

Power BI implementation

Import the Data sheet, create Total Sales and Total Profit measures, and use a clustered column chart with Region on the axis and Sales/Profit as values. Add RANKX measures to rank regions dynamically.

Interview Questions

Why compare profit with sales? Sales show revenue, while profit shows financial return after costs. Comparing both provides more context than sales alone.

How would you rank regions? Rank regions in descending order using a selected measure such as Total Sales or Total Profit. RANKX in Power BI can perform this dynamically.
